

Enhanced Product
AD8318-EP
FEATURES

- Wide bandwidth: 1 MHz to 8 GHz**
- High accuracy: ± 1.0 dB over 55 dB range ($f < 5.8$ GHz)**
- Stability over temperature: ± 0.5 dB**
- Low noise measurement/controller output (V_{OUT})**
- Pulse response time: 10 ns/12 ns (fall/rise)**
- Integrated temperature sensor**
- Small footprint LFCSP**
- Power-down feature: <1.5 mW at 5 V**
- Single-supply operation: 5 V at 68 mA**
- Fabricated using high speed SiGe process**

APPLICATIONS

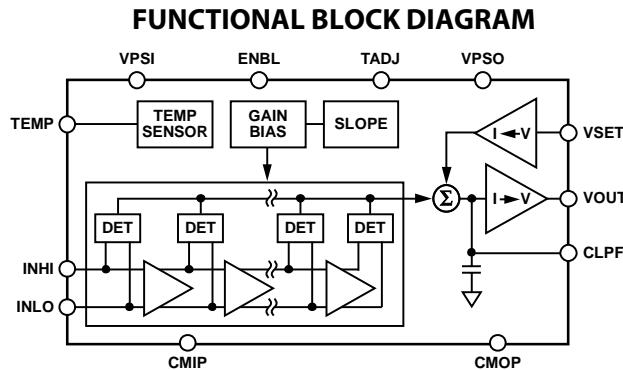

- RF transmitter PA setpoint control and level monitoring**
- RSSI measurement in base stations, WLAN, WiMAX, and radars**

GENERAL DESCRIPTION

The AD8318-EP is a demodulating logarithmic amplifier, capable of accurately converting an RF input signal to a corresponding decibel-scaled output voltage. It employs the progressive compression technique over a cascaded amplifier chain, each stage of which is equipped with a detector cell. The device is used in measurement or controller mode. The AD8318-EP maintains accurate log conformance for signals of 1 MHz to 6 GHz and provides useful operation to 8 GHz. The input range is typically 60 dB (re: 50 Ω) with error less than ± 1 dB. The AD8318-EP has a 10 ns response time that enables RF burst detection to beyond 45 MHz. The device provides unprecedented logarithmic intercept stability vs. ambient temperature conditions. A 2 mV/C slope temperature sensor output is also provided for additional system monitoring. A single supply of 5 V is required. Current consumption is typically 68 mA. Power consumption decreases to <1.5 mW when the device is disabled.

The AD8318-EP can be configured to provide a control voltage to a VGA, such as a power amplifier or a measurement output, from Pin V_{OUT}. Because the output can be used for controller applications, wideband noise is minimal.

In this mode, the setpoint control voltage is applied to VSET. The feedback loop through an RF amplifier is closed via V_{OUT}, the output of which regulates the amplifier output to a magnitude corresponding to VSET. The AD8318-EP provides 0 V to 4.9 V output capability at the V_{OUT} pin, suitable for controller applications. As a measurement device, Pin V_{OUT} is externally connected to VSET to produce an output voltage, V_{OUT}, which

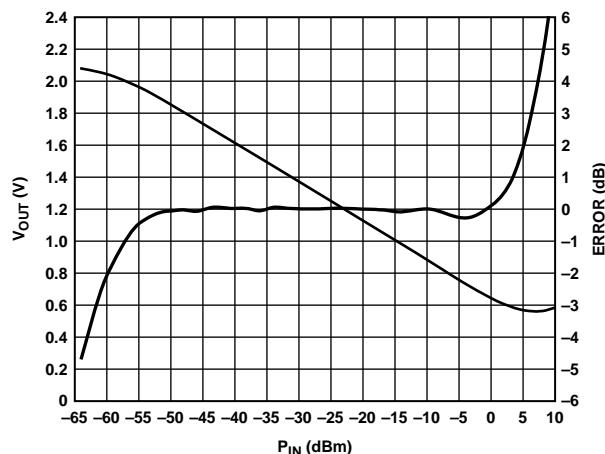

Figure 1.

10783-001

is a decreasing linear-in-dB function of the RF input signal amplitude.

The logarithmic slope is nominally -25 mV/dB but can be adjusted by scaling the feedback voltage from V_{OUT} to the VSET interface. The intercept is 20 dBm (re: 50 Ω, CW input) using the INHI input. These parameters are very stable against supply and temperature variations.

The AD8318-EP is fabricated on a SiGe bipolar IC process and is available in a 4 mm × 4 mm, 16-lead LFCSP. Performance is specified over a temperature range of -55°C to $+105^{\circ}\text{C}$.

10783-002

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage: Pin VPSO, Pin VPSI	5.7 V
ENBL, V_{SET} Voltage	0 to V_{POS}
Input Power (Single-Ended, $R_e = 50 \Omega$)	12 dBm
Internal Power Dissipation	0.73 W
θ_{JA}^1	55°C/W
Maximum Junction Temperature	130°C
Operating Temperature Range	–55°C to +105°C
Storage Temperature Range	–65°C to +150°C

¹ With package die paddle soldered to thermal pads with vias connecting to inner and bottom layers.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

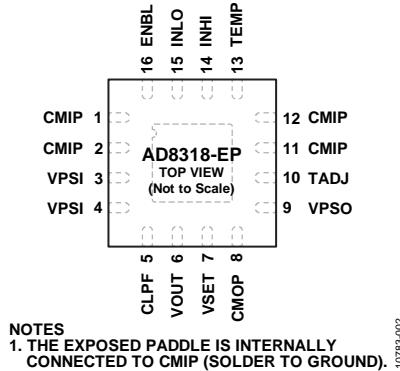

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES
1. THE EXPOSED PADDLE IS INTERNALLY CONNECTED TO CMIP (SOLDER TO GROUND).

10783-002

Figure 3. Pin Configuration

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 2, 11, 12	CMIP	Device Common (Input System Ground).
3, 4	VPSI	Positive Supply Voltage (Input System): 4.5 V to 5.5 V. Voltage on Pin 3, Pin 4, and Pin 9 should be equal.
5	CLPF	Loop Filter Capacitor.
6	VOUT	Measurement and Controller Output.
7	VSET	Setpoint Input for Controller Mode or Feedback Input for Measurement Mode.
8	CMOP	Device Common (Output System Ground).
9	VPSO	Positive Supply Voltage (Output System): 4.5 V to 5.5 V. Voltage on Pin 3, Pin 4, and Pin 9 should be equal.
10	TADJ	Temperature Compensation Adjustment.
13	TEMP	Temperature Sensor Output.
14	INHI	RF Input. Nominal input range: -60 dBm to 0 dBm (re: 50 Ω), ac-coupled.
15	INLO	RF Common for INHI. AC-coupled RF common.
16	ENBL	Device Enable. Connect to VPSI for normal operation. Connect pin to ground for disable mode. The Exposed Paddle is Internally Connected to CMIP (Solder to Ground).
